Oligonuclectides (AAT27589-25) encoding the growth factor region replacement domains A-D (AAR96224-27) were generated from 14 different oligonuclectides. Fragment B results in replacement of tPA amino acids 52-91 with the entire growth factor region of human Factor IX. Mutant tPAs were expressed in BHX cells and characterised for plasma half life and fibrin binding properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hybrid plasminogen activator comprises human tPA activator and N-terminal crosslinking domain from alpha2-plasmin inhibitor - useful to treat thrombosis and image blood clots.

The sequences comprise a central core repeat sequence, especially selected from the sequences AAA32094-A32096 with left and right flanking sequences. The polymucleotide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for alignucleotide fingerprinting and library screening and to design primers for microsatellite-primed PCR. Microsatellite markers are useful to locate specific economically useful genes in plant genomes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            868 ACCAGTAATGCTGAAGAGGTGAAGTTGAACGGTCCTATGAAGACCTACAAGACCTTTTA 927
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AGCAGACATGGCGGAGGGCTGCACCTGAAGGGGACGATGAAGGCCCACACGGACATGGT 137

New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.

Claim 2; SEQ ID NO 7535; 245pp; English

The invention relates to a purified nucleic acid molecule associated with catcation or muscle and fat deposition (designated LMFD), derived from catcation or muscle acid can specifically hybridise to a second nucleic acid can specifically hybridise to a second nucleic acid comprising an upper file of them. Also included are acid a transformed cell having a nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic acid comprising an LMFD nucleic acid dinked to a promoter and a 3 non-translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3 end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid molecule. On the molecule; and (b) detection of the molecule. The LMFD nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for level or pattern of the molecule in a bovine cell or tissue. The molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle for genetically improving cattle. The present sequence is one of the listue sequence was not shown in the specification but was obtained in celectronic format from the upporton=20020137139

Colon tumor associated proteins and nucleic acids useful for the prevention, diagnosis and treatment of colonic cancer. Xu J, Lodes MJ, Secrist H, Benson DR, Meagher MJ, Stolk JA; King GE, Wang T, Jiang Y; WPI; 2001-441847/47.

(CORI-) CORIXA CORP.

Claim 2; Page 390-391; 472pp; English.

The present invention describes colon tumour associated proteins (I) and the polynucleotides (II) that encode them. (I) have cytostatic activity.

(I) and (II) can be used in gene therapy and vaccine production. (I) and (II) may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate colon tumour associated protein (TCAP) expression, such as colonic cancer. For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of context of them. Additionally, (II) may be used to produce the TCAP proteins, by inserting the protein. (II) and its complementary sequences may also be used as DNA probes in diagnostic polymerase chain reaction (PCA) and hybridisation assays to detect and quantitate the presence of similar or nucleic acids in samples, and therefore which patients may be in need of cantibodies against TCAPs and in assays to identify modulators of TCAP expression and activity. Anti-(I) and stays to identify modulators of TCAP carbession and activity. Anti-(I) and activity. The anti-(I) antibodies may also be used as antigonists may also be used to down regulate TCAP expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of TCAP in samples (e.g. by enzyme linked immunosofbalt assay to the nucleotide and amino acid sequences given in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes compounds (I) for the immunotherapy and diagnosis of colon cancer. Also described: (1) a method for detecting the presence of cancer in a patient; (2) a method for stimulating and/or. expanding T cells specific for a tumour protein; (3) an isolated T cell population comprising T cells prepared by the method of (2); (4) a method for stimulating an immune response in a patient; (5) a method for treating cancer in a patient; (6) a method for development of cancer in a patient. (1) have immunostimulant and cytostatic activities and can be used in vaccines. ABZ32646 to ABZ33725
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   t H, Benson DR, Meagher MJ, Stolk JA;

NOV14a is a prostasin-like protein, and the NOV14a coding sequence localises to chromosome 16. The NOV proteins and coding sequences of the invention are useful for treating or preventing NOV-associated disorders or in the manufacture of a medicament for treating the disorders, such as cancer, heart disease, inflammation, autoimmune disorders, allergies,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   useful for preventing or inflammation, or tissue typing or

```

The present invention describes an expression vector (I) comprising in frame and in order, a presequence, a prosequence, and a cloning site for the in frame insertion of catalyric domain cassette. (I) can be used as a modulator of proteins expressed from a zymogen activation construct. The recombinant catalytic domain of serine protease is useful for identifying compounds modulating the activation of proteases is expressed and activated from the zymogen activation construct. A method from the present invention comprises combining a modulator of the recombinant catalytic domain of a protease and measuring an effect of the modulator on the protein preferably inhibiting or enhancing its enzymatic activity or stimulation or inhibition of proteolysis mediated by the expressed catalytic domain. The present sequence represents a specifically claimed

Expression vector for producing recombinantly producing serine protease domains, comprising a presequence, a prosequence, and a cloning site for the insertion of catalytic domain cassette.

WPI; 2000-687533/67.

                                                                                                                                                                                                                                                                                                                                                                                               2619
precursors of serine proteases (e.g. prostasin) in a highly controlled and reproducible fashion. The expression vector comprises, in frame and in order, a pre-sequence and a cloning site for in frame insertion of a catalytic domain cassette. The expression vectors of the invention are useful for the expression of heterologous inactive zymogen proteases that can subsequently be proteolytically processed to generate the active enzyme product. The active enzyme produce can be useful for directly treating diseases associated with inflammatory, reproductive, epidermal or neurological tissue or for identifying modulators of protease activity which can be used for treatment. The proteases can also be used in commercial products, e.g. laundry detergents stain-removing solutions and skin care products. The present sequence represents the encodes a prostasin protease sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                   478
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            418

The present sequence is a coding sequence for a NOV protein. The NOV proteins and coding sequences are useful for treating or preventing NOV-sessociated disorders or in the manufacture of a medicament for treating the disorders, such as cancer, heart disease, inflammation, autoimmune disorders, allergies, blood disorders, AIDS, diabetes, obesity, asthma, IGA nephropathy, cirrhosis, arthritis, Alzheimer's disease, infections (e.g. bacterial, viral, parasitic), stroke, muscular dystrophy, epilepsy, and other wasting disorders associated with chronic diseases. NOV14b is a prostasin-like protein, and the NOV14b coding sequence localises to

The present invention describes an expression vector (I) comprising in frame and in order, a presequence, a prosequence, and a cloning site for the in frame insertion of catalytic domain cassette. (I) can be used as a modulator of proteins expressed from a zymogen activation construct. The recombinant catalytic domain of serine protease is useful for identifying compounds modulating the activity of proteases is expressed and activated from the zymogen activation construct. A method from the present invention comprises combining a modulator of the recombinant catalytic domain of a protease and measuring an effect of the modulator on the strimulation or inhibiting or enhancing its enzymatic activity or stimulation or inhibition of proteolysis mediated by the expressed catalytic domain. The present sequence represents a specifically claimed fusion gene with a human serine protease catalytic domain from the

through limited proteolysis, the activation of expressed zymogen through limited proteolysis, the activation of expressed zymogen precursors of serine proteases (e.g. prostasin) in a highly controlled and reproducible fashion. The expression vector comprises, in frame and in order, a pre-sequence, a pro-sequence and a cloning site for in frame in order, a pre-sequence, a pro-sequence and a cloning site for in frame invention are useful for the expression of heterologous inactive zymogen proteases that can subsequently be proteolytically processed to generate the active enzyme product. The active enzyme produce can be useful for directly treating diseases associated with inflammatory, reproductive, epidermal or neurological tissue or for identifying modulators of protease activity which can be used for treatment. The proteases can also be used in commercial products, e.g. laundry detergents, stain-removing solutions and skin care products. The present sequence represents the construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               504 TGCAGGGAGGCAGATGGGCCGGATGTAGCGGGAGAAGGTGATGGGTCTGCTGAGTTGGAG 445

The invention relates to a gene expression profile comprising one or more genes (AB234889-AB23692) and generated from a cell type. The cell type of a coronary artery endothelium, umbilical artery or vein endothelium, actic endothelium, dermal microvascular endothelium, pulmonary artery continued profile endothelium, prometrium microvascular endothelium, real endothelium, renal profile epithelium, renal epithelium, renal proximal tubule epithelium, renal cortical epithelium, renal profile epithelium, renal cortical epithelium, umbilical artery smooth muscle, small airway epithelium, renal epithelium, umbilical artery smooth muscle, commerce, mescle, mesangial cells, ocronary artery smooth muscle, dermal fibroblast, neural progenitor cells, skeletal muscle, astrocytes, actric smooth muscle, uncortinued smooth muscle, lung fibroblast, osteoblasts or prostate stromal cell. The gene expression profile is used for determining the level of RNA expression for a sample, determining the phenotype of a cell and distinguishing cell types. The gene or a protein expression profile is useful in identifying disease pathologies involving alterations of gene expression. The assessment of expression profile may also be used for creating microarrays. The microarray is useful for may also be used for creating microarrays. The microarray is useful for may also be used for creating microarrays. The microarray is useful for medical diagnosis, genotyping of genomes, DNA sequencing, genetic or medical diagnosis, genotyping of organisms, confirming cell or tissue confirming cell or tissue may income and in identifying promising antibiotics, antiviral or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Farnesyl transferase inhibitor modulated leukemia associated gene #81.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New gene expression profile generated from primary, endothelial, epithelial, and muscle cell types, useful for identifying disease pathologies involving alterations of gene expression, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ss; cytostatic; farnesyl transferase inhibitor; gene expression; quinolinone; leukemia; cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Efficient processing and release of mature two-chain factor X into the circulation requires: removal of the signal sequence, formation of disculation of discussion of emino terminal glutemaic acid residues, to gamma-carboxyglutamic acid; modification of one aspartic acid in the first epidermal growth factor (BGF) domain to Beta-hydroxyaspartic acid in the first epidermal growth factor (BGF) domain to Beta-hydroxyaspartic acid; modification of N- and O-linked oligosaccharides to the activation peptide; cremoval of an internal tripeptide to these modifications do not appear essential for factor X function the removal of the signal sequence, propeptide, internal tripeptide and full gammacraboxylation are all steps which are important requisites for the production of biologically active factor X/FXa. Isolated chimeric polynucleotides are described which encode a propeptide fused to a nucleic acid sequence encoding a vitamin K-dependent protein (WXDP). The fusion proteins and recombinant call y gamma-carboxylation of a WXDP to produce a fully gamma-carboxylation of a WXDP to produce a fully gamma-carboxylated without a carboxylation of fully gamma-carboxylated mature wXDPs, which are biologically active. The invention encompasses all combinations of the propertied sequence (modified or not) and WXDPs, which are biologically active. The invention encompasses all combinations of the properties (modified or not) and wXDPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chimeric DNA for optimizing gamma carboxylation of vitamin K-dependent protein useful for treating diseases associated with the protein, comprises sequence encoding propeptide fused to sequence encoding the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, artery, endothelium, umbilical, vein; aorta, pulmonary artery,

The invention relates to an isolated polymucleotide (I) comprising: (a)

any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b)

complements of (a); (d) sequences consisting of at least 20 contiguous

residues of (a); (d) sequences that hybridize to (a), under moderately

creditions; (e) sequences having at least 75% or 90% identity

co (a); or (f) degenerate variants of (a). Polypeptides (ABP68596-

ABP68637) encoded by (I) and oligonucleotide can be used to detect cancer

catibodies, fusion proteins; T cell populations and antigen presenting

calls expressing the polypeptide are useful in treating pancreatic cancer

can stimulating an immune response. The polymucleotides can be used as

probes or primers for nucleic acid hybridisation, in the design and

preparation of ribozyme molecules for inhibiting expression of the tumour

preparation of ribozyme molecules for inhibiting expression of the tumour

comprehence and proteins in the tumour cells, in vaccines and for gene

comparation of ribozyme molecules for inhibiting expression of the tumour

preparation of ribozyme molecules for inhibiting expression of the tumour

comparation of ribozyme molecules for inhibiting expression of the tumour

preparation of ribozyme and proteins in the tumour cells, in vaccines and for gene

comparation of ribozyme data for this patent did not form part of the

printed specification, but was obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of determining whether a patient will respond to treatment with a farnesyl transferase inhibitor (FTI), by analyzing the expression of gene that is differentially modulated in the presence of an FTI. The method is useful for determining whether a patient will respond to treatment with a FTI such as (3)-6-[amino(4-chlorophenyl) (1-methyl-1H-imidazol-5-yl)methyl)-4-(3-chlorophenyl) in methyl-2-(if)quinolinone, monitoring the therapy of a patient, treating a patient with leukemia with FTI if the analysis indicates that the patient will respond. This sequence corresponds to a gene whose expression may be modulated in the presence of FTI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining whether a patient will respond to treatment with a farnesyl transferase inhibitor, by analyzing the expression of gene that is differentially modulated in the presence of the inhibitor.

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the substance P, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases han inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                The present invention describes a method using novel primers involving the PR-based determination of histocompatibility locus antigen B (HLA-B) class I group type. Determining the HLA-B class I group type of a subject class I group type. Determining the HLA-B class I group type of a subject comprises: (i) combining a group-specific untranslated region primer pair with a target DNA sample from the subject under conditions such that primer based amplification of the target DNA may occur; and (ii) determining whether a nucleic acid product is produced by the amplification; where the ability of the primer pair to produce a nucleic amplification; where the ability of the primer pair to produce a nucleic can be used for HLA-B typing. In the method, the initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. It permits the resolution of cis/trans linkages of percentages. PAX37845 to AAX38286 respecsent DNA sequence used in the exemplification of the present invention
                                                                                             Determination of HiA class I group type of a subject - using group specific untranslated region primer pair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 244 BP; 31 A; 91 C; 90 G; 32 T; 0 U; 0 Other;

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and non-coding targions of RNAs corresponding to target genes, coding and codons, genemic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX5572-74. These multiple target oligonucleotides may be derived sequences AAX55710-71 can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, distress syndrome, pain, cystic fibrosis, pulmonary hypertension, cucte asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary and cancers such as leuvemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lancer, melanoma, heptic metastases, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       well as all types of cancers which may metastasize or have metastasized
to the lungs, including breast and prostate cancer

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchlis, emphysema, respiratory distress syndrome, ischemia or

Disclosure; Page 503; 1343pp; English

The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 158), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiniflammatory, antialergic, and/or conflammation. The ON can have antiniflammatory, antialergic, antialergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation.

CC impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating of e.g. ischaemic conditions, pulmonary viscomitions, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic through the respiration, respiratory distress syndrome, pain, cystic throasis, pulmonary hypertension, emphysema, chronic obstructive conflowers, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the release of decoxyadenosine which may metastasise to the lungs, including breast and prostate cancer. The A-containing ONs break down with the release of decoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA33313 to AAA33312 represent the nucleidus sequences given in the sequences differ from the previously named sequences. Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.

Claim 14; Page 245; 1592pp; English.

The present invention describes low adenosine (A) content antisense cligonucleotides and compositions (I) comprising them. In the antisense cligonucleotides the A is replaced by a 'Universal' or alternative base. (C) ligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. Cr The antisense oligonucleotides and (I) can be used to down-regulate the ung/respiratory disorders and malignancies, such as stimulating and creativity of target polypeptides associated with lung/respiratory disorders and transmitters, transcription factors, chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide creeptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide antisense oligonucleotides may be used in this way to treat disorders creeptors, binding proteins and malignancy associated proteins The antisense oligonucleotides may be used in this way to treat disorders condition selected from pulmonary vasocoactive peptides and on and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasocoactive pulmonary disease (CNDS), pain, cystic fibrosis (CP), allergic rhinitis (AR), pulmonary hypotections in malyeanes and condition, respiratory distrass syndrome conditions mandyon respiratory condition, pulmonary disease (CNDD), cullenger, invention antisense oligonucleotides used in the exemplification of the present invention

Pabalan J, Aguilar D; Katz E, Sandrasagra A, Ke 5, Shahabuddin S; Li Y, San Tang L, Nyce JW, Lu

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 11264; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the instantion coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antihiflammatory steroid and ubjquinone. A composition of the invention has antihiflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an artiniflammatory steroid in a subject, for reducing levels of adenosine of or or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, stissue, or respiratory disease or condition, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed section, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, and as ABX34813-ABX49947, or complements of them. Also included are in the call having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3 non-translated sequence that acid linked to a promoter and a 3 non-translated sequence that functions in the cell to cause termination of transcription and addition of polyademylated ribonucleotides to a 3 end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or itsue comprising; (3) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement of fragment) with a complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid permits the detection of the complementary nucleic acid sequences or its complementary nucleic acid permits the detection of the complementary nucleic acid secured to a molecule in a bovine cell or tissue.

The action of the complementary nucleic acid is used for level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cartle breeding, preparation of constructs for use in cattle gene expression, or for genome intension is not be an expression, or for genetically improving cattle. The present sequence is one of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polynucleotide (1) comprising; (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV9945); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately stringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABF68596-ABF66517) encoded by (1) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polymeticotides antibodies, fusion proteins, T cell populations and antigen presenting cells expressing the polypeptide are useful in treating pancreatic cancer
15112 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site: seqdata.uspto.gov/sequence.html?DocID=20020137139
                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lodes MJ, Persing DH, Hepler WT, Jiang Y;

ruct used to transfect hosts - to produce protein which to give factor VIIa. DNA construct activates to c

Disclosure; Fig 7; 55pp; English.

The cDNA is a fusion of Factor IX and Factor VII. It is used to express Factor IX and Factor VII. CDNA encoding Factor VII can be used in DNA construct which contains a nuclectide sequence encoding a protein which, on activation, has the same biological activity for blood coagulation as Factor IIa. The nuclectide codes at least partially for Factor VII and comprises a sequence encoding a calcium binding domain joined to a sceond sequence downstream of this encoding a catalytic domain for the serine protease activity of Factor VIIa. The calcium binding domain comprises a gene encoding Factor VII. IX, X, Protein C, prothrombin or Protein S. The construct is used to transfect host cells to produce the protein which, on activation, yields Factor VIIa. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)

The present invention describes a method for screening drug candidates. The method comprises adding a drug to a cell that expresses an expression profile gene encoding a protein encoded by 5 sequences of defined base pairs as given in C5563, C5564, C55643, C55644 and C55653 or a sequence represented by Genbank accession number X92521, X62466, J04130, X62087 and X76534 (or a fragment) and determining the effect of the drug on the expression of the expression profile gene. An inhibitor of matrix metalloprocteinase 19 (MMP-19), preferably an antibody, is useful for treating destructive macrophage disorders (DMD) by inhibiting DM development in a cell of an individual having arthritis. Antibodies to WMP-19 are useful for localising a therapeutic moiety preferably composition comprising WMP-19 is useful for eliciting an immune response in an individual. C55635 to C55710 represent human differentially Example 2; Fig 35; 99pp; English. regulated genes of the invention

Screening drug candidates comprises adding a drug to a cell expressing an expression profile gene and determining the effect of the drug on the expression of the expression profile gene.

The invention relates to diagnosing (M1) a destructive macrophage disorder (DMD) or determining (M2) the prognosis of an individual with DMD, by determining the expression of the gene encoding MMP-19. (M1) involves comparing the expression of the gene encoding MMP-19 in a first tissue type of a first individual, with expression of the gene from second normal tissue from the individual, with expression of the gene from second normal tissue from the individual, with expression of the determining level of MMP-19 in sample, where high level of MMP-19 in candidates (involves providing a cell that expression of fewer indicates poor prognosis. Also included are screening (M3) drug candidates (involves providing a cell that expresssion as expression profile gene which encodes a protein encoded by any one of 5 expression profile gene which encodes a protein encoded by any one of 5 expression profile gene which encodes a protein encoded by accession number X9221, X62466, J04130, X62078 and X76534, or its fragment; adding a drug candidate to the cell, and determining the effect of the drug candidate on the expression of the expression profile gene), screening (M4) for a bloactive agent capable of modulator protein (where the DM modulator protein (where the DM modulator protein (where the DM modulator protein (where the DM modulator protein or its fragment, screening for a bloactive agent capable of interfering with the binds of a DM modulator protein or its fragment and an antibody (II) which specifically binds to MMP-19, or its fragment, screening antisense molecules to MMP-19. The DM cell by administering antibody (II) which specifically binds the protein or its fragment and an antibody is useful for treating antibone protein or its fragment and antibody is Diagnosing destructive macrophage disorder (DMD) such as arthritis, aneurysms or atherosclerosis, or determining prognosis of individual with DMD, by determining expression or level of matrix metalloproteinase-19. The invention relates to novel proteins involved in the biosynthesis of polyketide dorrigocin (DORR) or lactimidomycin (LACT) biosynthesis by microorganisms. Sequences of the invention allow direct manipulation of dorrigocin, lactimidomycin and related chemical structures via chemical engineering of the enzymes involved in the biosynthesis of dorrigocin and lactimidomycin. They are useful for introducing chemical handles into normally inert positions that permit subsequence chemical modifications and facilitate the development of polyketides. The genes and proteins of the invention can also be used to generate a focused library of analogues around a polyketide lead candidate to fine-tune the compound for optimal properties. They are useful for generating antibodies specific for the Novel isolated or purified polypeptide involved in biosynthesis of polyketide dorrigocin or polyketide lactimidomycin, useful for preparing dorrigocin or lactimidomycin. modulator protein is useful for eliciting an immune response in an individual. The methods and compositions are useful for treating a DWD such as arthritis, inflammatory bowel disease, chronic obstructive pulmonary disorder and vascular disease, including atherosclerosis and aneurysms. detecting the level or pattern of the complementary nucleic acid, where the detection of the complementary nucleic acid is predictive of the level or pattern of the molecule. The LMFD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the 15112 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The present sequence was not shown in the specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2651 GATGGCTGGATGGCATCACTGACTCGACGTGAGTCTGGGTGAACTCCTGGAGTTGG 2710

                                                                                                                                                                                                                                                                                                                                 à
acid linked to a promoter and a 3' non- translated sequence that functions in the cell to cause termination of transcription and addition of pulyadenylated ribonucleotides to a 3' end of the makin molecule; and (2) determining a level or pattern of a molecule in a bovine cell or issue comprising; (a) incubating a marker nucleic acid (comprising any of the 15112 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where the detection of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is used for level or pattern of the molecule in a bovine cell or tissue. The LMFD nucleic acid is used for certaining a level or pattern of a molecule in a bovine cell or tissue. The correction of the molecule in a bovine cell or tissue. The correction of the molecule is acid is used for a testing, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the present sequence was not shown in the specification but was obtained in the constructs for a site:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                              79 dakadakaradadadakakaracadadagachakaratarakarakararakadaka 138
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; foetal liver; gene expression; single exon nucleic acid probe; ss.
The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                  .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                     79 GGAGGGAGTGGGGGCAGAATGCAGGGGCAAACATGCTAAACTGGGTATTGAGCACC

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involuse contracting the probes with a collection of detectably labelled nucleic acids derived from expression of the microarray. The probes are useful for verifying the probes of the microarray. The probes are useful for verifying the corporation of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or proposing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring sessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.
                                                                                                                                                            Human; microarray; single exon probe; gene expression; breast; disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.6%; Score 22.6; DB 1; Length 468; 60.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived probe thuman heart via microarrays. By measuring gene expression, the probes are useful for predicting, dispnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease, Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic

They can be used from genomic sequences expressed in the human which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  79 GGAĞGGAGTGGGGGCAĞCAGAATGCAĞGGGGCAAACATGCTAAACTGGGTATTGAĞCACC 138

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe breast. The probes are useful for a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, saging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocyptic changes, proliferative breast disease and noncarcinoma tumours. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2608 GGAGGGATTGGGGGCCAGGAGGAGGGACGACAGAGGATGAGATGGCTGGATGGCATC 2667

The partial factor VII cDNA sequence is produced by joining portions of cDNA clones lambda VII2115 and lambda VII1923. It is used in a DNA construct which contains a nucleotide sequence encoding a protein which, on activation, has the same blological activity for blood coagulation as Factor IIa. The nucleotide codes at least partially for Factor VII and comprises a sequence encoding a calcium binding domain joined to a sceond sequence downstream of this encoding a catalytic domain for the serine protease activity of Factor VIIa. The calcium binding domain comprises a gene encoding Factor VII. IX, X, Protein C, prothrombin or Protein S. The construct is used to transfect host cells to produce the protein which, on activation, yields Factor VIIa. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

(CURA-) CURAGEN CORP.

Leach MD, Shimkets RA;

WPI; 2002-106200/14. P-PSDB; ABP32698. Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and disorders related to organ transplantation.

Claim 1; Page 1094; 2508pp; English.

Sequences ABP31028-ABP35561 represent 4534 novel human proteins designated ORF (open reading frame) 1-4534, and sequences ABN75054.

Gesignated ORF (open reading frame) 1-4534, and sequences ABN75054.

ABN79587 represent DNAs encoding them. The invention also encompasses polypeptides at least 88 identical to referred to as ORFX) proteins, polynucleotides at least 88 identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX to polynucleotides. The recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of screening for modulators of ORFX sepression or activity, and methods of screening individuals for a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide control of the order of biological activities, such as ovioxine, cell proliferation, cell differentiation, immune modulation, mematopoists regulation, cell differentiation, immune modulation, mematopoists regulation, cell differentiation, immune modulation, thrombolytic activity, chemotatic, chemokinetic activity, has mostatic activity, thrombolytic activity, chemotatic, cell differentiation, immune modulation, has manipulation activity, chemotatic, and antihined activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, other proliferative disorders such as psoriasis and bonign tumours, corporation activity, and antibodies may be used in Alzheimer of sacrae, and infectious associated by viral, bacterial, fungal and other pathogens. ORFX nucleic acids may also be used as a sequence, in genetic dispense, and infectious diseases caused by viral, bacterial, fungal and other pathogens. ORFX nucleic acids may also be used as a sequence, in genetic dispense, and infectious diseases caused by viral, bacterial, fungal and other pathogens. ORFX nucleic acids may also be used as sequences, in genetic dispense, and infectious of primers and probes; and the detection of ORFX genomic acids may additionally be use

Hepler WT, Jiang Y; Lodes MJ, Persing DH, Benson DR, Kalos MD, New isolated polynucleotide and pancreatic tumor polypeptides, useful for diagnosing, preventing and/or treating cancer, particularly pancreatic

Claim 1; SEQ ID NO 3367; 300pp + Sequence Listing; English.

The invention relates to an isolated polynuclectide (I) comprising: (a) any of a group of over 4000 nuclectide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences consisting of at least 20 contiguous residues of (a); (d) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP66596-C) ABP66637) encoded by (I) and oligonuclectide can be used to detect cancer in a patient and compositions comprising polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells expressing the polypeptide are useful in treating pancreatic cancer and stimulating an immune response. The polynucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and polypeptides and proteins in the immune for gene to polypeptides and proteins in the immune for gene therapy. Note: The sequence data for this patent did not form part of the

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases. Alzheimer's and Parkinson's diseases. Note: The degenerate codon within the sequence represents the position of an SNP, for example the letter S represents a polymorphism where the nucleotide may be C or G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and

The invention relates to an isolated polynuclectide (I) comprising: (a) any of a group of over 4000 nuclectide sequences (ABV94628-ABV93145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately to (a); or (f) degenerate variants of (a). Polypeptides (ABP68596-C) at least 20 contiguous (b) sequences having at least 75% or 90% identity. (b) appearate on compositions on antigen presenting on a patient and compositions comprising polypeptides, polymucleotides, or nucleotides (all polypeptides or be used as probes or primers for nucleic acid hybridisation, in the design and propertiens and proteins of athe tumour cells, in vaccines and for gene therapy. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at feb. wipo.int/pub/published_pot_sequences Claim 1; SEQ ID NO 3117; 300pp + Sequence Listing; English.

Hepler WT, Jiang Y; Persing DH, Lodes MJ, Benson DR, Kalos MD, WPI; 2002-627435/67. New isolated polynucleotide and pancreatic tumor polypeptides, useful diagnosing, preventing and/or treating cancer, particularly pancreatic

Claim 1; SEQ ID NO 3884; 300pp + Sequence Listing; English.

The invention relates to an isolated polymucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (BN94628-AN99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridiac to (a), under moderately crimpent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP68596-CC ABP6863) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions of polypeptides (ABP68596-CC ABP6863) encoded by (I) and oligonucleotide can be used to not in degenerate polypeptides are useful in treating pancreatic cancer in a patient and compositions. T cell populations and antigen presenting calls expressing the polypeptide are useful in treating pancreatic cancer of simulating an immune response. The polymucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and preparation of tibozyme molecules for inhibiting expression of the tumour cells, in vaccines and for gene therapy. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly come with the polyment of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community of the community o

Schlegel R, Endege WO,

Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.

Claim 1; Page 1389; 11750pp; English.

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer. (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker

```
The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 1512 nucleotide sequences, appearing as ABX34836-ABX99947, or complements of them. Also included are (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3 non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3 end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the complementary nucleic acid permits the detection of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the complementary nucleic acid is useful for general for pattern of a molecule in a bovine cell or tissue.

The is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs. For use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the present sequence was not shown in the specification but was obtained in celectronic format from the USPTO web site:

The present invention relates to the isolation of cDNA sequences encoding human pancreatic tumour proteins. The polynucleotide sequences encoding human pancreatic tumour proteins are useful for stimulating an immune response in a patient and treating pancreatic cancer in a patient. A host cell that expresses these polynucleotides is useful for determining the protein experience of cancer in a patient. A composition comprising the polynucleotide, its encoded protein, or an antibody that binds to the protein may be used in the diagnosis, prevention and/or treatment of diseases, particularly pancreatic cancer. The sequences of the invention are also useful in pharmaceutical compositions, e.g. vaccines, for the diagnosis and treatment of pancreatic cancer. Such compositions may be useful for inhibiting the development of cancer in a patient, or as market for the progression of cancer. The polynucleotide sequences may also be used as probes or primers for nucleic acid hybridisation assays.

ABNA44061-ABNA4209 represent cDNA sequences encoding for human pancreatic

AAT03999-T04001 are all human cDNA sequences which code for pancreatic trypsin III (AAR87203), the sequences differ only in their stop codons. The cDNA molecules can be used in the recombinant production of trypsin which can be used as a drug to treat diseases wherein trypsin production is impaired. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Expression vectors E.coli LE 392 and YA 21 are preferable for mass production, and animal cells or B.subtilis are suitable for the production of an enzyme of similar activity to that of natural human spleen trypsinogen. Culturing the recombinant cells produced the desired trypsin as insoluble protein in inclusion bodies and the trypsin can be isolated by lysing the cells by a suitable method. The trypsin can be isolated and purified. The product is used in the treatment of lesions or trauma, eg burns, gangrene, abscesses, injury etc. (Updated on 25-MAR-2003 to correct PA field.)

The invention relates to a gene expression profile comprising one or more genes (ABZ34889-ABZ35692) and generated from a cell type. The cell type is a coronary artery vendothelium, unbilical artery or vein andothelium, cortic endothelium, dermal microvascular endothelium, prostate epithelium, bronchial epithelium, renal proximal tubule epithelium, prostate epithelium, renal cortical epithelium, renal proximal tubule epithelium, prostate epithelium, renal proximal tubule epithelium, muscle, camal airway epithelium, renal epithelium, renal proximal tubule epithelium, contic smooth muscle, neoratal dermal fibroblast, pancorary artery smooth muscle, carrier, muscle, mesangial cells, coronary artery smooth muscle, carrier smooth muscle, lung fibroblast, coronary artery smooth muscle, cortic smooth muscle, uterine smooth muscle, lung fibroblast, coronary artery smooth muscle, corrected stromal cell. The gene expression profile is used for determining the phenotype of a cell and distinguishing cell types. The gene or a protein phenotype of a cell and distinguishing cell types. The gene or a protein alterations of gene expression profile is useful in identifying disease pathologies involving alterations of gene expression with respect to tumour type and stage, treatment methods, and prognosis. The gene or protein expression profile may also be used for creating microarrays. The microarray is useful for genetic and physical mapping of genomes, DNA sequencing, genetic or medical diagnosis, genotyping of organisms, confirming cell or tissue identifications and in identifying promising antibiotics, antivixal or antifungal agents

Oligonuclectide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.

Claim 7; Page 183; 294pp; English.

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Pactor V, Factor VIII, Pactor IX, haemoglobin alpha locus (HBA21), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APCB), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-2 (BERN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanowa, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblascoma, BRCA1, BRCA2, CTR, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus apolipoprotein E (APDE), IDL receptor (LDLR), WDP-glucuronosyltransferase (UGTI), amyloid precursor protein (ARC), presentilin-1 (PSEN1) and presentilin-2 (SSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, although the deaminase deficiency, cystic fibrosis, although the deaminase deficiency, cystic fibrosis, although the deaminase deficiency cystic fibrosis, although the deaminase deficiency cystic fibrosis, although the deaminase deficiency cystic fibrosis, although the deaminase deficiency cystic fibrosis, although the deaminase deficiency cystic fibrosis, although the deaminase deficiency cystic fibrosis, although the deaminase deficiency cystic fibrosis, although the deaminase deficiency cystic fibrosis, although the deaminase deficiency cystic fibrosis, although the deam of the deaminase deficiency cystic fibrosis, although the deam of the deaminase deficiency cystic fibrosis, although the deaminase deficiency cystic fibrosis, although the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of the deam of deam of the deam of the deam of the deam of the deam of the deam of deam of the deam of the deam of the deam of the deam of the deam of t
Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 121 BP; 28 A; 28 C; 16 G; 49 T; 0 U; 0 Other;

Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.

Claim 7; Page 183; 294pp; English.

The present invention provides single-stranded oligonuclectides which can be used for the targeted alteration of genomic sequences, where the oligonuclectide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTK, Cyclin-dependent Kinase inhibitor 2A retinoblastoma, BRCA1, BRCA2, CFTK, Cyclin-dependent Kinase inhibitor 2A (HBA1), haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolicoprotein E (APOS), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentiln-1 (PSEN1) and presentiln-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, had anomalia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithehial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the crvix, notably cervical cancer. Note: The sequence data for this patent did not form patr of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                      Probe #14645 for gene expression analysis in human cervical cell sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              12 GCTGAACGAGAGAGAGAGACCCGGGAGGAGGCAGTGCGAGAGCTGCAGGAGATGGTGCA 71

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foctal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                  Human; foetal liver; gene expression; single exon nucleic acid probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        12 GCTGAACGAGAGAGAGCCCGGGAGGAGGCAGGGAGGCTGCAGGAGATGGTGCA 71

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Probe #18760 used to measure gene expression in human placenta sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Probe #15265 for gene expression analysis in human heart cell sample.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bane marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, brain expressed exon, gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 4; SEQ ID NO 18621; 658pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and e.g. cardiovascular disease. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2655 GCTGGATGGCATCACTGACTCGATGGACGTGAGTCTGGGTGAACTCCTGGAGTTGGTGAT 2714
                                                                                                                                                          The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheiner's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

2655 GCTGGATGGCATCACTGACTCGATGGACGTGAGTCTGGGTGAACTCCTGGAGTTGGTGAT 2714
liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipidaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABS25011-ABS51005 represent human liver single exon nucleic acid probes of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequence;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; ds; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histiocytosis; lymphangioletomyomtosis; Karagener syndrome; pulmonary hyeolar proteinosis; fibrocystic pulmonary dyskinesis; pulmonary hypertension; hypaliasy ciliary dyskinesis; pulmonary hypertension; hypaline membrane disease; open reading frame; ORF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon probe ORF from lung SEQ ID No 18288.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DB 1; Length 224;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                47; Indels

The invention relates to a purified nucleic acid molecule associated with catcation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 1512 nuclectide sequences, appearing as ABX34886-ABX4947, or complements of them. Also included are caid linked to a promoter and a 3' non- translated sequence that caid linked to a promoter and a 3' non- translated sequence that caid linked to a promoter and a 3' non- translated sequence that corporations in the cell to cause termination of transcription and addition of the comprising a level or pattern of a molecule in a bovine cell or cassue comprising a level or pattern of a molecule in a bovine cell or tissue comprising a level or pattern of a molecule in a bovine cell or complementary nucleic acid molecule obtained from the bovine cell or complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid pattern of the complementary nucleic acid sequences or its complementary nucleic acid molecule. The LMFD nucleic acid, is used for the detection of the complementary nucleic acid is predictive of the acterning a level or pattern of the complementary nucleic acid is used for the molecule. The LMFD nucleic acid, is used for the molecule. The LMFD nucleic acid is used for the sequence mapping, gene identification and analysis, cattle for genetically improving cattle. The present sequence is one of the constant sequence was not shown in the specification but was obtained in plantary in the present sequence is not shown in the specification but was obtained in New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, ô Score 21.8; DB 1; Length 361; Pred. No. 98; 0; Mismatches 27; Indels 0 Sequence 361 BP; 117 A; 62 C; 83 G; 99 T; 0 U; 0 Other; deposition, useful for genome mapping, gene identific cattle breeding, or for genetically improving cattle. segdata.uspto.gov/sequence.html?DocID=20020137139 Tao N, Warren WC; present sequence was not shown in the specelectronic format from the USPTO web site: Claim 2; SEQ ID NO 7535; 245pp; English. 12-JAN-1999; 99US-0115707P. o.6%; Similarity 58.5%; Byatt JC, Mathialagan N, Ouery Match Best Local Similarity 58.5: Matches 38; Conservative (BYAT/) BYATT J C.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the present invention relates to the isolation of cDNA sequences encoding human pancreatic tumour proteins. The polynucleotide sequences encoding human pancreatic tumour proteins are useful for stimulating an immune response in a patient and treating pancreatic cancer in a patient. A host presence of cancer in a patient. A composition comprising the polynucleotide, its encoded protein, or an antibody that binds to the protein may be used in the diagnosis, prevention and/or treatment of diseases, particularly pancreatic cancer. The sequences of the invention are also useful in pharmaceutical compositions, e.g. vaccines, for the diagnosis and treatment of pancreatic cancer. Such compositions may be useful for inhibiting the development of cancer in a patient, or as markers for the progression of cancer. The polynucleotide sequences may also be used as probes or primers for nucleic acid hybridisation assays. The markets for the progression of cancer acid hybridisation assays.

Transmembrane serine protease MP493 for diagnosis of and developing drugs for cancer, kidney diseases and lung diseases e.g. asthma, allergy, bronchitis, pneumonectasis, pancreatitis and nephritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      185 ACTAGTCAATCACACTAGGACCACAGCCTTGTCTAACTCAATGAAACTAAGCCAT 244
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of a thuman serine procease designated MR493. The sequences can be used in the diagnosis of and development of drugs for treating cancer, kidney and lung diseases, for example asthma, allergy, bronchitis, pneumonectasis, viral diseases, shock, multiple organ failure, pancreatitis and nephritis. The present sequence is a coding sequence shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Deletion; cistron; expression; human insulin; interferon; interleukin; tissue plasminogen activator; growth hormone releasing factor; translational activating sequence; HPI; human proinsulin; ds.

                                                                                                                                                                                                                                                                        Example 3 describes the construction of plasmid pHDM121. The gene encoding MetTyr human proinsulin was produced from synthesised oligonucleotides, which, when annealed, comprise both complementary strands of the MetTyr human proinsulin gene with Ndel-BamHI cohesive ends. (Updated on 25-MAR-2003 to correct PN field.)

This sequence was used in the construction of the expression vector of the invention. The coding region of the hbl gene was synthesised and was cloned into the expression plasmid pCZR126S (see also AAG38307).

Expression of this gene lead to the inclusion of an extra amino acid (Arg) in the second position from the N-terminal of mature hpl. The extra amino acid chost provides increased expression levels of the protein acid then cleaved off to avoid undesirable immuno-logical effects when used in humans. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Expression of low molecular wt. polypeptide(s) e.g. insulin growth factor I - by expressing as deriv. with N-terminal aminoacid to provide increased expression levels.
                                                                                                                                                                                                                                                                                                                                                       166 cerecadecedecedecedecedecedecededecedecededecededecedededed 107
was, together with other components, used in the construction of plasmid pRB145. See also AAQ05662-3, AAR06443-4 and AAR07658-60. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a synthetic polymucleotide encoding 2 or more immunogenic HIV polypeptides, where at least 2 of the polypeptides are derived from different HIV subtypes. The polymucleotide is useful for immunisation, generation of packaging cell lines, or production of HIV polypeptides. The polymucleotide and its encoded proteins are useful as immunogenic compositions or vaccines for generating humoral or cellular immune responses against HIV. The gene delivery vector comprising the polymucleotide is also useful for DNA immunisation of, or for generating antimunogenic esponses (e.g. a humoral or cellular immune response (e.g. a humoral or cellular immune response) in, a subject such as a mammal, particularly a human. This sequence encodes a human immunodeficiency virus immunogenic peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunogenic HIV polypeptide; human immunodeficiency virus; HIV; vaccine; gene therapy; packaging cell line; humoral immune response; cellular immune response; gene delivery vector; DNA immunisation; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New expression cassettes and polynucleotides encoding HIV Gag, Nef, Prot, Tat, Rev, Vif, Vpr, Vpu, or Env polypeptides, useful for DNA immunization or generating an immune response against HIV in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an expression cassette comprising a polynucleotide sequence encoding a polypeptide including an HIV Gag, Nef, Port, Tat, Rev, Vif, Vpr, Vpu, or Env polypeptide. The expression cassettes, HIV polypeptides and polynucleotides encoding the HIV polypeptides are useful for DNA immunization or generating an immune response against HIV in a subject. The polynucleotides are also useful for generating packaging cell lines or producing the HIV polypeptides. The present sequence represents a HIV plSRnaseH.opt.SF2 nucleotide sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a purified nucleic acid molecule associated with catcation or muscle and fat deposition (designated LMFD), derived from catcation or muscle acid can specifically hybridise to a second nucleic acid molecule cacid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nuclectide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are compressed to a promoter and a3 'non-translated sequence that cacid linked to a promoter and a3 'non-translated sequence that comprising a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (comprising any complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid septemble obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the complementary nucleic acid permits the detection of the complementary nucleic acid permits the detection of the molecule. The LMFD uncleic acid is used for the detection of the molecule. The LMFD nucleic acid, subset for the acterning a level or pattern of the molecule. The LMFD mucleic acid, subset for the complementary nucleic acid is used for the substructs for use in catle gene expression, or for generically improving cattle. The Present sequence is one of the complement sequence was not shown in the specification but was obtained in a laboration in a laboration of constructs for use in catle and analysis, acitle of present sequence was not shown in the specification but was obtained in a laboration of the complement expension of the sequence was not shown in the specification but was obtained in a laboration of the complement expension of the sequence was not shown in the specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GACTIGIATITICIAATATITIACTITATICIATITITIACTITIAATITGCACTIATITITATIGA 3016

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel gene library (A) comprises a gene sequence (or its part) encoding a protein involved in amino acid synthesis, cellular/energy metabolism, metabolism of fatty acids/phospholipids, synthesis or breakdown of purines/pyrimidines/nucleosides/nucleotides, DNA replication/transcription/translation, or is a transport/binding protein. (A) are produced that correspond to the 3' -end of mRNA but without the polyA tail. They can be prepared more efficiently and with less effort than conventional libraries. AAK53416-AAK54275 represent fragments of the gene library described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              326 idecingcacacacaterretreceaeaceacatrerreardacerecedeaetearrie 385
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Murine transport and binding associated protein encoding cDNA SEQ ID 314.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gene library containing sequences with specific 3'-ends and no polyA tail, encoding proteins involved in a wide range of cellular processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Murine, liver, gene library, amino acid synthesis, binding protein, cell metabolism, energy metabolism, fatty acid metabolism, synthesis, phospholipid metabolism, purine, pyrimidine, nucleoside, nucleotide, replication, transcription, transcription, transcription, transcription,

WPI; 2003-058374/05. P-PSDB; ABG73119 Novel factor VII polypeptide, its derivatives useful for preparing medicament for treating bleeding episodes, or for enhancing normal hemostatic system, especially for treating hemophilia.

Disclosure; Page 82-85; 96pp; English.

The invention discloses a human factor VII polypeptide, or a variant or derivative of it, where an amino acid has been modified. This change results in a polypeptide with the same or an increased activity when compared to recombinant wild type human factor VIIa. Blood coagulation compared to recombinant wild type human factor VIIa. Blood coagulation consists of a complex interaction of various blood components that consists of a complex to a fibrin clot. Initiation of the hamostatic process is mediated by the formation of a complex between tissue factor or and Factor VIIa (the active form of the Factor VII zymogen). This complex activates Factors V and VIII leading to a full thrombin burst. The activates Factor VII zymogen, or its derivative, can be modified in its clot. The Factor VII zymogen, or its derivative, can be modified to activate plasma factor X or IX. The factor VII deplypeptide to activate plasma factor X or IX. The factor VII delivative is useful for preparing a medicament for the treatment of bleeding episodes, for the preparing a medicament for the treatment of bleeding chrombus formation. The inactivated factor VII derivatives are useful for treatment of the mormal hamostatics are useful for treating intimal

New antisense compound targeted to nucleic acid encoding estrogen receptor alpha and inhibiting expression of estrogen receptor alpha, useful for treating a disease or condition e.g. a hyperproliferative disease.

Claim 20; Page 232; 232pp; English.

This invention relates to human oestrogen receptor alpha (ESR-alpha), and the novel antisense oligonuclectides that modulate its expression. The ostrogen receptor alpha protein is also known as oestrogen receptor 1, ESR1, and NR3A1. Oestrogen, the steroid hormone ligand of ESR-alpha, is important for bone maintenance and plays a protective role in the cardiovascular system, as well as being required for normal sexual maturation through promoting growth and differentiation. Splice variants of ESR-alpha, however, have been associated with various cancers oligonuclectides that inhibit the expression of ESR-alpha in cells or tissues can be used in gene therapy to treat conditions such as

(TSP) polypeptide, comprising a protease domain of a type-II membrane-
type serine protease or its biologically active portion. The invention is
useful for cleaving a TSP substrate protein by contacting TSP with a
substrate protein under serine protease activity permissive conditions.
The invention is useful as an immunogen to generate antibodies that bind
TSP or TSP1-TSP43 proteins, useful for treating disease e.g. cancer and
autoimmune disease. The present sequence is human TSP1-TSP34 gene exon
hyperproliferative disease, inflammation, tumour formation and to prevent or delay infection. As such, the present invention describes these antience oligos as having cytostatic, antiinflammatory and antimicrobial activities. This polymucleotide is the DNA of the human oestrogen receptor alpha splice variant designated ESR-alpha VII of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New purified transmembrane serine protease polypeptides (TSP1-TSP34) comprising a protease domain or its biologically active portion, useful for identifying modulators of proteolysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; transmembrane serine protease; TSP; therapy; immunogen; cancer; autoimmune disease; immunomodulatory; immunosuppressive; enzyme; ds.

The present invention relates to a nucleotide construct with optimised codons for use as a human immunodeficiency virus (HIV) DNA vaccine. The construct uses codons from highly expressed mammalian proteins to code for each derivative of an early, primary HIV envelope gene. The first stage in the production of the construct was the cloning of an HIV envelope gene. A nucleotide sequence encoding this gene was then created using codons from highly expressed mammalian genes. The present sequence is one of the snuts (AAA49060-A49079) that were created by redesigning this nucleotide construct so that restriction enzyme sites surrounded functional regions of the sequence. The snuts were then assembled into pieces (AAA49080-A49092). Each derivative of the envelope gene (AAA49083-A49097) was then built using the pieces. The HIV DNA vaccine may be used as a prophylactic vaccine and as a therapeutic vaccine in HIV infected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        patients. The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99165); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences consisting of at least 20 contiguous residues of (a); (d) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a) Polypeptides (ABF6856 to ABF68637) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polymelectides, and patient and compositions comprising polypeptides, polymelectides, and intibodies, fusion proteins, T cell populations and antigen presenting cells expressing the polypeptide are useful in treating pancreatic cancer and stimulating an immune response. The polymulacides can be used as probes or primers for nucleic acid hybridisation, in the design and preparation of ribozyme molecules for inhibiting expression of the tumour perparation of ribozyme molecules for inhibiting expression of the tumour the tumour cells, in vaccines and for gene therapy. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and pancreatic tumor polypeptides, useful for diagnosing, preventing and/or treating cancer, particularly pancreatic
                                                                                                cancer; gene therapy; vaccine; immunostimulant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 21.4; DB 1; Length 380;

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert or cytosine (C) but not methylated C, to uracil, then part of the genomic supplicant in the contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligoners and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligoners, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognesis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastroinestinal and respiratory systems etc. particularly by detecting mutations or single nucleotide polymorphisms (SNP'S); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultanceusly. ABOJAHO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3206 TICITIGALAACAGCITCAGTICTAIGGCITIAAIAAAGIITITITITITITITITITI 3265

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert octosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes oligomers, the degree of methylation is calculated. The method is used: if for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              84 TITITATATTAGAAAATACGATITGTAAAGTATATTTAGGGTGTTTTTTTAATTTTTA 25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      particularly by detecting mutations or single nucleotide polymorphisms (SNP's), and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foctal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                         Human, foetal liver, gene expression, single exon nucleic acid probe, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Probe #23734 used to measure gene expression in human placenta sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4 AGACCACTGGAACAATGAGAAGGAGAATTCTACTGGTCACAGACAAGACTCTTGAT

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of
                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4 AGACCACTGGAACAATGAGAAGGAGAATTCTACTGGTCACAGACAAGACTCTTGAT

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult ther. Comprising one of 13109 defined nucleotide sequences given in the specification (or complements, fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABSISOII-ABSISOS represent human liver single exon nucleic acid probes of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                 2764 ACACGACTGAGCAACTGAACTGAACTGAACTGAAACCTTAGTAGTAGTTTATATACT 2823
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic sequenced tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4 AGACCACTGGGAACAATGAGAAGGAGAGATTCTACTGGTCACAGACAAGACTCTCTTGAT 63

The invention describes a method of monitoring differential expression of content in a first Bacillus cell relative to expression of the genes in other than a calls, comprising hybridasing labelled nucleic acid probes isolated from Bacillus cells, comprising hybridasing labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus genomic sequenced tags (GST), examining the array, and determining relative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for menauring the expression of genes in a first Bacillus cell relative to expression of the same genes in or more second Bacillus cells. The method is useful for monitoring genes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Monitoring che way in which Bacillus cells adapt to changes in culture conditions, in which Bacillus cells adapt to changes in culture conditions, on the confinence represents a genomic sequence information is available. This sequence represents a genomic sequence information is available. This sequence represents a genomic sequence information is available. This sequence represents a genomic sequence information is available. This sequence expenses of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                         à
                                       The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 or 1 the specification). ABM15762 to ABM27222 encode the human ORFX proteins given in ABP00101 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a squences can be used in gene therapy. ORFX sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, or sociated with ORFX-associated disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ cramplantation, cardiovascular disorders, disorders, infectious corage disease, various immune deficiencies and disorders, infectious croage disease, autoimmune disorders such as multiple sclerosis, rheumatorid arbitis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also cuseful for treating burns, incisions, ulcers, for treating obsectorosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, competcion or regeneration and treatment of lung or liver fibrosis, creperitation injury in various tissues and conditions resulting observation cytokine damage. NuB. The sequence data for this patent did not corm part of the printed specification, but was obtained in electronic corm part of the printed specification, but was obtained in electronic corm.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated human protease nucleic acid molecule comprising a nucleotide sequence of 546 base pairs, one of 268 fully defined in the specification. Also disclosed are production of an isolated polypeptide encoded by the nucleic acid, comprising introducing the nucleic acid into a host cell and culturing under conditions to express the protein from the nucleic acid, use of an antibody to detect the encoded protein in a sample and to modulate its in vivo activity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polynuclectides encoding protease homologs of the G-protein-coupled protease family, useful in identifying agonists and antagonists for diagnosis and treatment of protease mediated disorders.
                                                                                The invention relates to human breast cancer expressed polynucleotides (AALO7544-AALS6789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                             2764 ACACGACTGAGCAACTGAACTGAACTGAACTGTACTGAAACCTTAGTAGTTTATATTACT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene therapy; transgenic;

treminity and agents that annow to the pivotesh and identification of a complement (i.e. gene that modulates the expression of the mucleic acid can be used to its complement (i.e. gene that modulates the expression or activity of the complement of an explaint modulates the expression or activity of the concleic acid, and can be used to isolate the protein. The mucleic acid can be used in diagnostic assays for determining nucleic acid expression or activity in the connext of a biological sample (e.g., blood, serum, cells, tissue) to determine whether an individual has a disease or disorder, or is at risk of developing a disease or disorder, associated of with aberrant expression or activity of the mucleic acid. The nucleic acid can be used to detect mutations in protease genes and gene expression probes to detect naturally-occurring genetic mutations in a protease gene. The nucleic acid can be used as the protease mediated disorders that can be used to diagnose and treat or identify agonists and antagonists that can be used to diagnose and treat as probes, primers, in biological assays, to determine patterns of gene expression, to design ribozymes and to construct transgenic animals. The presents sequence represents one of the 268 disclosed human G-proteinidentifying agents that bind to the protein and identification of a

Novel isolated protease polypeptide and polynucleotide encoding the polypeptide useful for diagnosing and treating diseases or conditions associated with a protease.

Claim 4; Page 80-81; 160pp; English.

The invention relates to a novel isolated polypeptide comprising an amino acid sequence that has greater than 95 % identity to any one of 47 150-850 residue protease polypeptide sequences, given in the specification. The nucleic acids, probes, primers, polypeptides and antibodies of the invention can be used in methods of diagnosis of a susceptibility to a

ö The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and astmma), cardiovascular diseases (e.g. restenosis and coronary thrombosis), brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. rethritis and psorials); central or peripheral nervous system diseases, migraines, pain, sexual dysfunction, mood disorders, attention Human, protease, cancer; immune-related disorder; cardiovascular disease, neuronal-associated disease; metabolic disorder; inflammatory disorder; nervous system disorder; sexual dysfunction; pain; mood disorder; hypertension; psychotic disorder; neurological disorder; dyskinesia; viral infection; human immunodeficiency virus; HIV; non-viral infection; ocular disease; cytostatic; gene; ds. 143 inaitreccararatiasarcareciersecertrreritrecaartricircait 202 203 ggalioggaldatriadecaataedicidaetidearitgiridetaeagaatgetagaa 262 Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory 2908 IGATITITCICIACITATITAATITITGGGATITITAACIATITCAATGACTIGIATIT Gaps ..                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes a protease T fusion protein. Protease T is useful for treating a condition mediated by protease T. It is useful for treating an imbalance of desquamation, by topical application of a pharmaceutical composition containing the protease. The composition is useful as a topical skin care composition. It is useful as a laundry detergent, shampoo, hard surface cleaning composition, and dish care cleaning composition, and dish care cleaning composition. Protease T protein is useful for treating and and it provides skin flaking. It is less immunogenic to sensitive individuals environment
                                                                                                                                                                                                                                                                                            2683 GIGAGICIGGGIGAACICCIGGAGITGGTGAIGGACAGGGAGGCCIGICCIGCGGCGAIT

The invention provides polypeptides (AAG65886-65918) which may be peptide hormones (including insulin, growth hormones, chemokines, cytokines, neuropeptides, integrins, Halikreins, lamins, melanins, naturitetic hormones, neuropepsin, pituitary hormones, pleiotrophins, prostaglandins, seretogranins, selectins, thromboglobulins, thymosins) identified by high throughput genome-based biology and polymoleotides (AAI67176-67208) encoding them. The polypeptides can be expressed by standard recombinant methodology. The polypeptides are useful in the treatment of disease such

Isolated polypeptides, which may be peptide hormones, which are identified by high throughput genome-based biology which identifies and gene products as therapeutic targets for treatment of diseases s

cleaning composition, dish care cleaning composition, skin care composition and hair care composition. Protease C-E is useful for treating and preventing skin flaking, neurodegenerative disorders and dermatological pathologies. It is less immunogenic to sensitive individuals and it provides efficient proteolytic activity in a nonnatural environment. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                  Query Match

It comprises bowine preprolactin signal sequence fused inframe with MoAbM2 anti-FLAG antibody epitope for the purpose of secretion and antibody detection (FR), enteropinase cleavage site from human trypsinogen I (EK), catalytic domain of protease C-E and six histidine codons (6XHIS). Protease C-E gene located on chromosome 16p13.3 is a member of the SI serine protease family and is expressed in pancreas, placente, prostate, small intestine, stomach, spleen, fibroblasts, epidermis, cerebellum, cerebral correx, pituitary and hippocampus. Protease C-E is useful for treating an imbalance of desquamation, by topical application. A non-pharmaceutical composition comprising the protein may be formulated as a laundry detergent, shampoo, hard surface

A plasmid contey this construct was transfected into BHK cells which were then cultured to produce PAP-I-protein C fusions which were activated to a form fully active in both amidolytic and
